### Learning Objectives

1. Identify two critical issues in aging and Alzheimer's disease and related dementias (ADRD) research.
2. Discuss consequences and ways forward in ADRD biomarker research
3. Develop strategies based on a presented case study regarding PET brain imaging for research.
4. Understand basic conceptual principles and methodological approaches associated with social cognitive processes.

### Abstract

The field of aging and dementia faces two intertwined issues - disparities in dementia risk, particularly among Black and Latino adults, and the severe under-inclusion of these very populations in related research. As biomarkers bring our field toward new disease-modifying treatments, these advancements are threatened by the above two issues. This CE talk will identify and further discuss these two critical issues in aging and dementia research, including related consequences. Furthermore, the speaker will outline two enmeshed ways forward - diversity in research participation and methodological approaches. Here, the speaker will outline the role of social cognitive process, mixed methods approaches, and how these two elements contribute to our field. Afterward, we will discuss a mixed methods research study conceptualized, conducted, and implemented by the speaker and her team.
